

# Developing an R package: a tutorial

---

Ghislain Durif

July 2021

CNRS – IMAG (Montpellier, France)

## Note for the reader

Many [hyperlinks](#) are directly embedded in the slide contents.

# Requirements (1)

- [R](#) (the latest version if possible<sup>1</sup>, [4.1.0](#) since 2021-05-18)
- You can use the R command line combined with any text editor, but we recommend to use an R-oriented IDE<sup>2</sup> like [Rstudio](#) or [RKWard](#)
- All content presented here have been tested on a Linux environment but should work on **any OS**
- **Note for Windows users:** you can update R from within R with the [installr](#) package and you will need to install [Rtools](#) to enable all R development functionality

---

<sup>1</sup>Keep your software up-to-date! If you need an older version of R for a specific project, use appropriate tools like containers, it should be an exception not a habit.

<sup>2</sup>[Integrated Development Environment](#)

## Requirements (2)

- See the script `install_requirements.R`<sup>3</sup> to install the packages that will be used in the tutorial
- To (re)generate the slides, see the scripts<sup>3</sup> `.setup.R` to install the requirement, `.build.R` to build the `pdf` slides

---

<sup>3</sup>or the attached `Makefile` if you are comfortable with using `make`

# References

- Official R documentation: *Writing R Extensions*[↗](#)
- Karl Broman[↗](#) **tutorial**: *R package primer* ([web version](#)[↗](#) and [sources](#)[↗](#))

# What is an R package?

- a library containing a set of R functions (and possibly more) implementing functionality not available in default R functions<sup>4</sup>
- a standardized way to distribute R codes (for other users)

---

<sup>4</sup>or reimplementing existing functionality in a different way

# Where can I find R packages?

- the **CRAN**<sup>↗</sup> (Comprehensive R Archive Network): official repository for R packages

```
install.packages("devtools")
```

- **bioconductor**<sup>↗</sup>: bioinformatics-oriented package repository
- any git forge: github, gitlab
- on your colleagues' computers<sup>5</sup>

---

<sup>5</sup>if they develop in R

# Why R packages?

- The **best way** to write and distribute **R code** with **documentation, examples, tests**, etc.
- A good practice<sup>6</sup> when coding in R:
  - your project is structured (code, data, doc), easier to use and re-use
  - documentation is essential (including for your future self)
  - your code is standardized, you can check it and test your functions
  - easy management of dependencies
  - etc.

---

<sup>6</sup>even for codes you don't plan to publish/distribute

# How to write an R package?

A wide variety of tools to help you:

- Rstudio IDE built-in development features
- R base built-in tools: `build` (`R CMD build`), `check` (`R CMD check`)
- Some packages to develop packages:
  - `usethis` : to automate package and project setup
  - `devtools` : complete collection of development tools
  - `roxygen2` : to document your code and generate help pages
  - `testthat` : to implement automatic tests of your functions
  - `remotes` : to install package from anywhere (integrated in `devtools`)
  - `rmarkdown`  and `knitr` : to create detailed documentation materials and notebooks (code showcase)

# Outline

1. The essentials to write your package ([.md](#) and [.pdf](#))
  - Getting started
  - R package structure
  - Workflow
2. Going further with your R package development ([.md](#) and [.pdf](#))
  - Getting started
  - Digression: Good practice for software development and programming (not just in R)
  - Test your functions
  - Sharing (your code) is caring
  - Advanced documentation
  - Non R code
  - Control your R environment
